

Design Documentation

1. Project Description

The project is a personal website that serves as my professional portfolio. It showcases my background, skills, and the projects I have worked on. The website is built using HTML, CSS, and JavaScript.

While the homepage has a simple design, the simplicity is intentional — the clean and minimal layout ensures that visitors can easily learn about me and my work without distractions.

2. User Personas

Persona 1

Name: John

Occupation: Recruiter

Goal: Review a candidate's portfolio to assess whether their background and skills align with job requirements.

Scenario: John quickly browses through the projects to evaluate if the candidate's experience matches the role he's hiring for.

Persona 2

Name: Mary

Occupation: Frontend Developer

Goals: Explore the structure, styling, and interactivity of the website for inspiration and potential collaboration.

Pain Points: Poorly structured code or unclear navigation.

Scenario: Mary visits the site to understand the design system, layout organization, and implementation techniques used in the project.

3. User Stories

As a recruiter, I want to view a summary of skills, education, and projects so that I can evaluate the candidate efficiently.

As a developer, I want to explore the project layout and source code for best-practice ideas in frontend structure.

As a visitor, I want to easily access the contact and social links to connect with the site owner.

4. Design Mock-ups

5. Technical Details

Languages Used:

HTML5 for semantic structure

CSS3 for layout, typography, and responsiveness

JavaScript (ES6) for interactivity

Version Control: Git & GitHub for tracking changes and hosting the project

Hosting: GitHub Pages

Design Principles:

Mobile-first approach

Accessibility-aware structure (alt text, ARIA labels)

Fast load times with optimized assets

Clean, modular CSS structure (separate stylesheet for components)

6. Future Enhancements

Add a light/dark theme toggle using CSS variables and JavaScript.

Integrate a contact form with email forwarding via Formspree or Netlify.

Implement project filtering or a dynamic project gallery using JSON data.

Include animation effects (e.g., scroll reveals, fade-ins) for enhanced visual engagement.

Add a blog section to share insights, experiences, and project breakdowns.
